Agenda

- Overview of NREL's work in South Asia
- Context for Energy Storage Potential
- Policy and Regulatory Considerations for Energy Storage
- Technical and Economic Potential for Energy Storage
- Conclusions

NREL South Asia Program

GTG
USAID-MOP

Conclusion: India's grid can balance the 175 GW of RE

Tools: Detailed operations model of India
High fidelity weather data (maps.nrel.gov/rede-india)

Cross-Border
Electricity
Trade in
South Asia

Conclusions: Increased cross-border electricity trade (CBET) has regional and individual country benefits
Increased RE capacity could increase opportunities for CBET

Tools: Detailed operations model of South Asia region
CBET regulatory roadmaps for Nepal, Bangladesh, India

Planning and
Operations
Studies

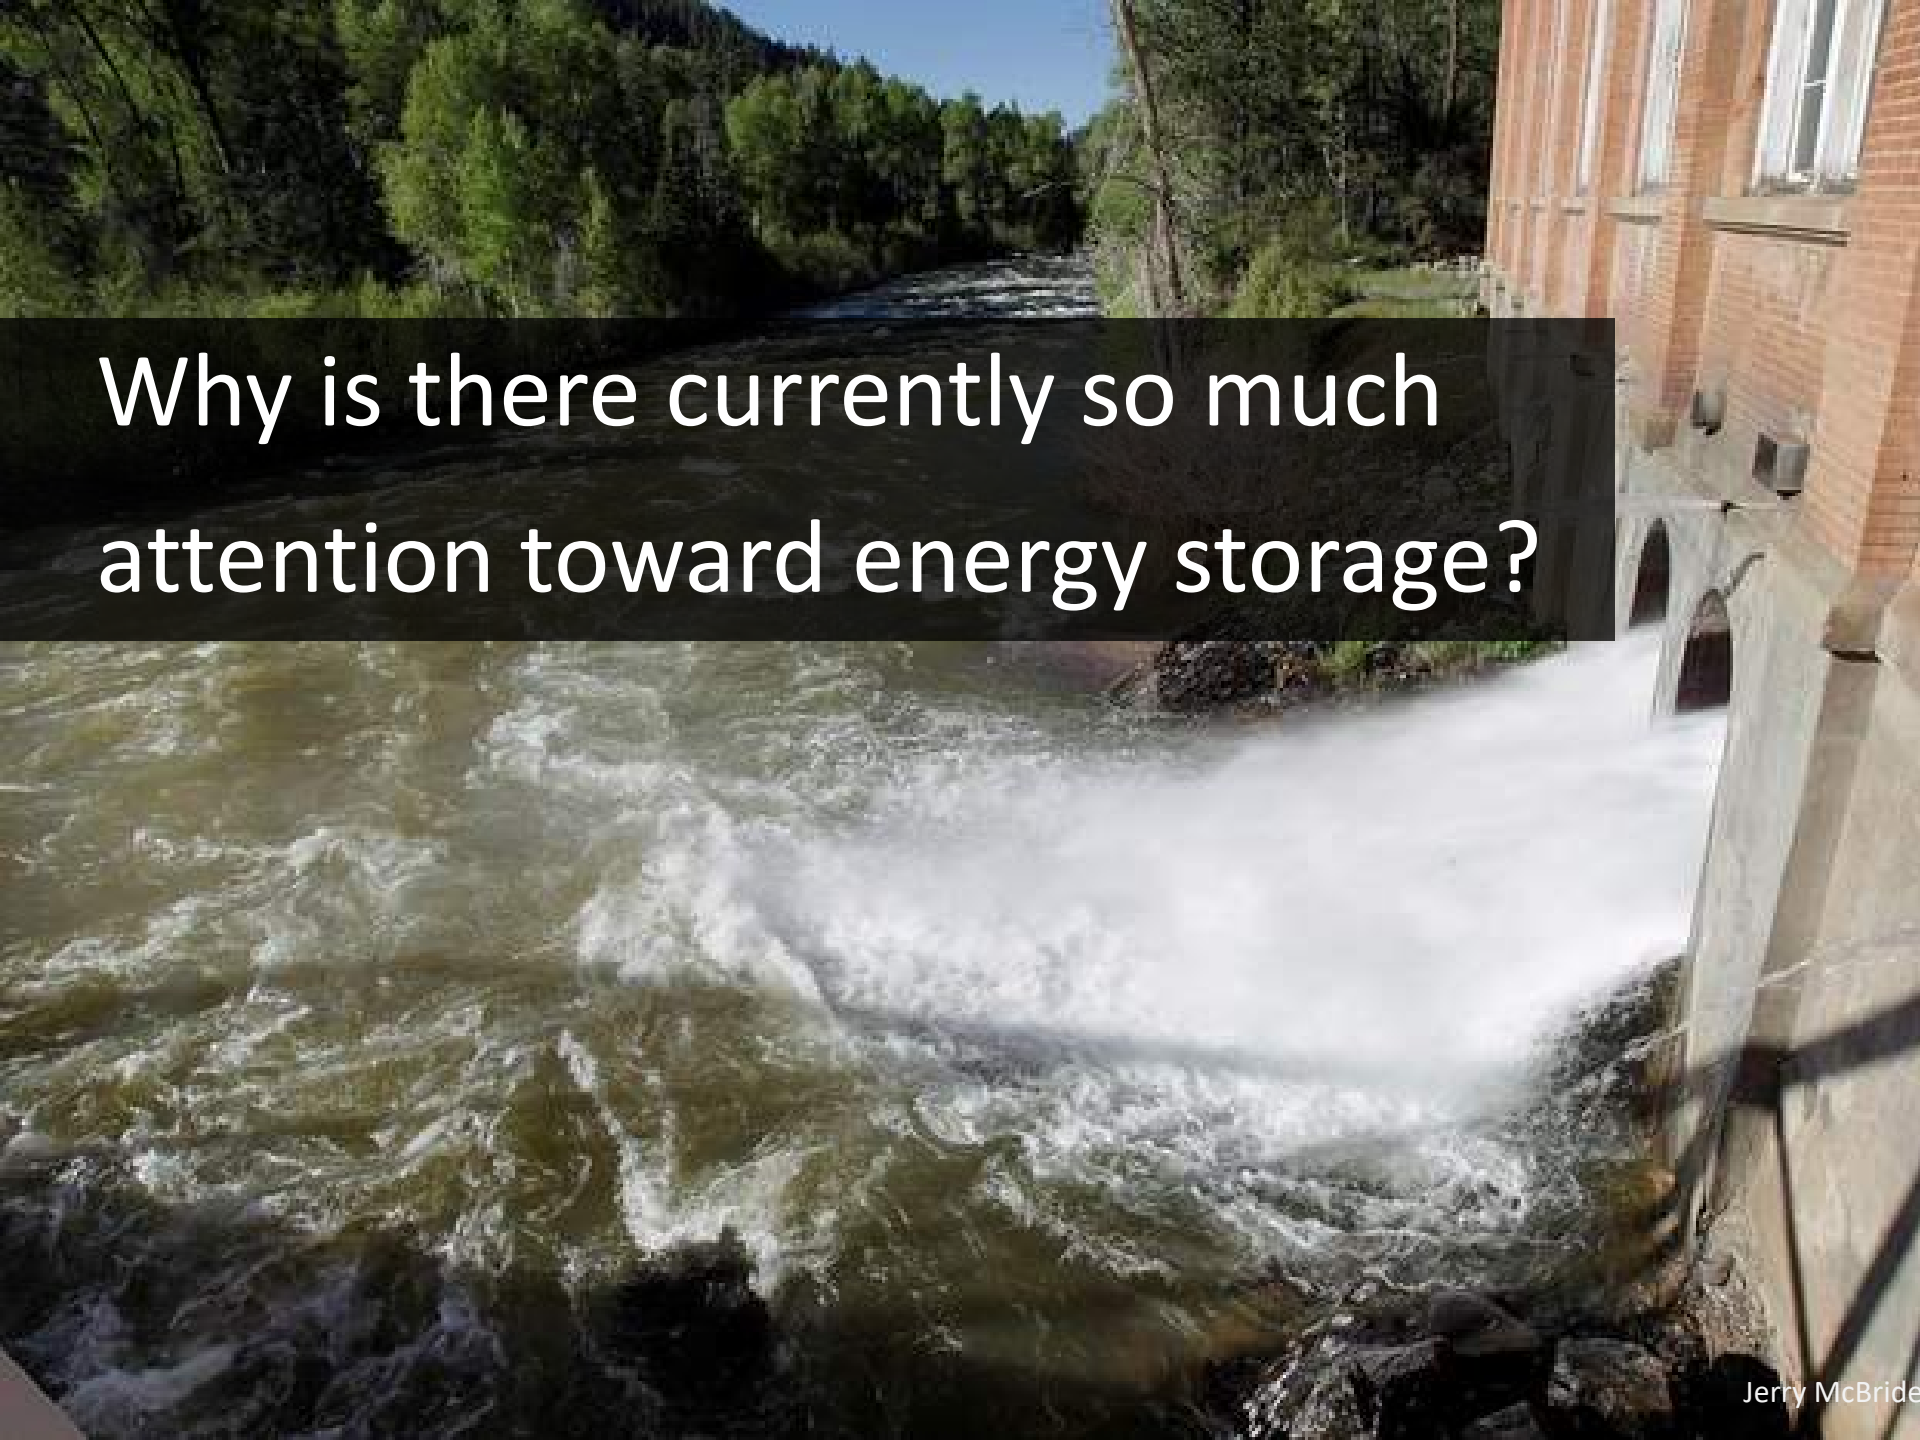

Ongoing:

- Least-cost capacity expansion planning in India
- Operations in 2030 (targets for RE changing fast...)
- Working with India's states to plan for high RE futures

Energy Storage in South Asia

Context

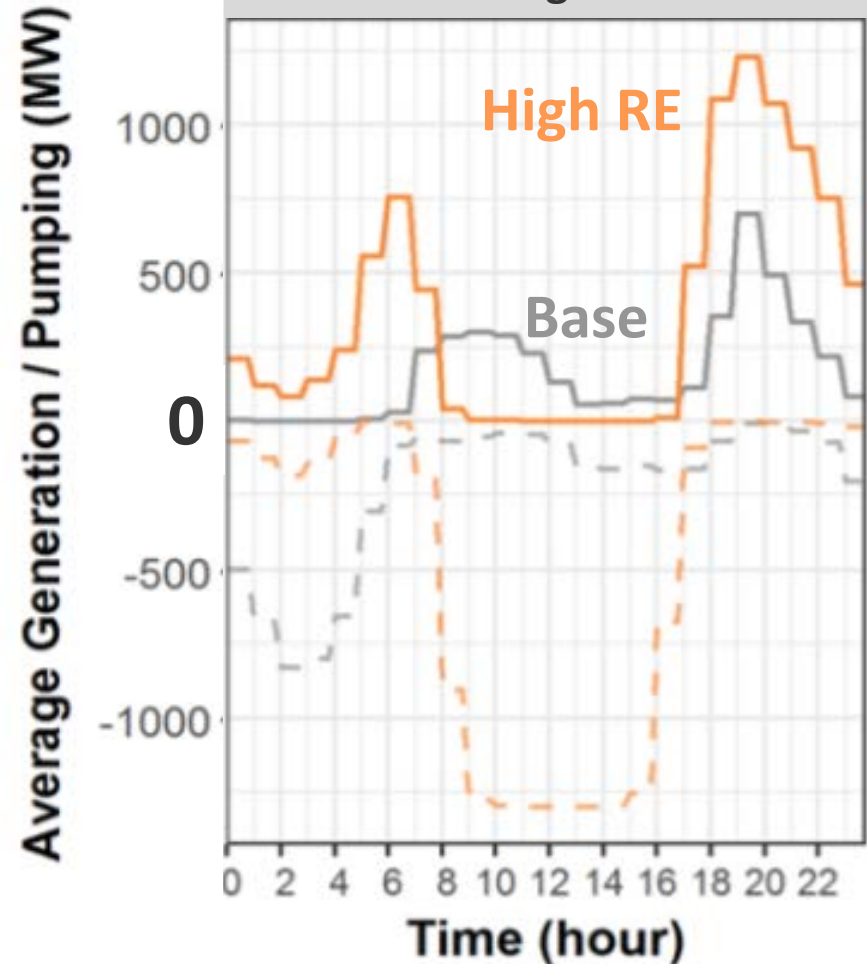

Why is there currently so much attention toward energy storage?

Grids are transforming to higher levels of RE

Example from Greening the Grid Study:

22% generation from wind and solar

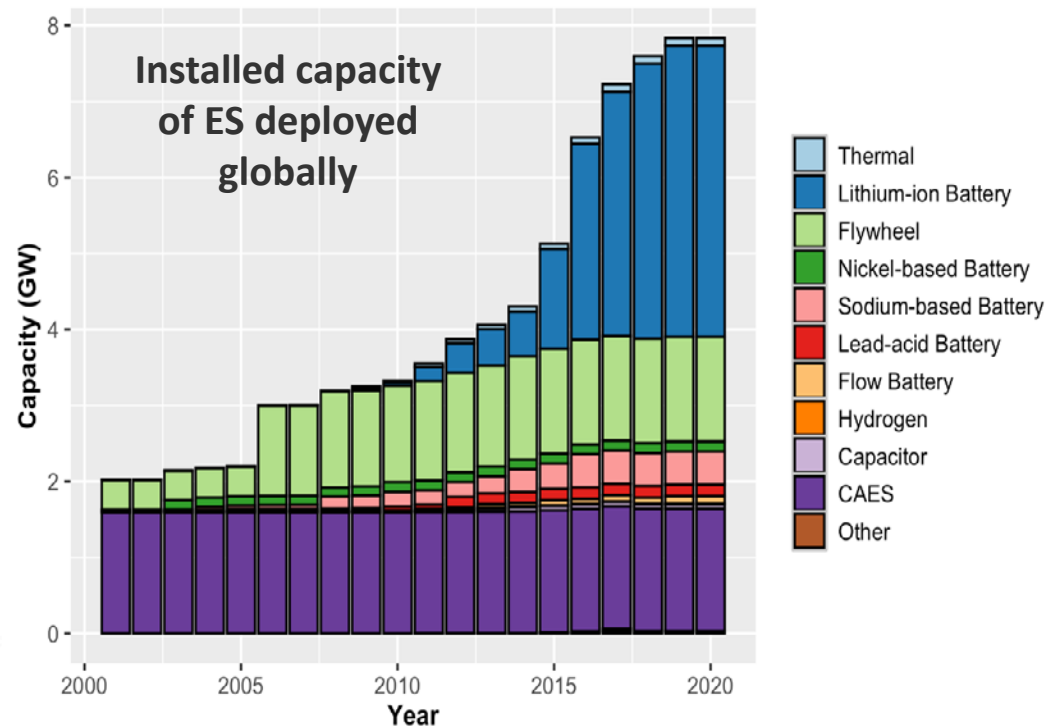

Costs are declining

2018 lithium-ion battery price survey results: volume-weighted average

Battery pack price (real 2018 \$/kWh)

Energy storage – what we already know

- Energy storage (ES) can increase the flexibility of the grid.
- ES can complement variable renewables, but new investments in ES are not necessarily needed to integrate large amounts of renewable energy (e.g., GTG study for India).
- ES has many potential applications for the grid. A primary challenge is in properly valuing them through regulations and markets.
- Planning for ES requires a systems-level approach, in part because ES value is sensitive to other changes on the grid such as solar growth or fuel prices.

What is the focus of this project?

- Grid-connected ES that is “utility-scale” (greater than 1 MW)
- ES that is interconnected to the bulk power system (voltages > 100 kV)
- Hydro reservoir storage is considered; however the outcomes are more focused on ES that can “charge”
 - E.g., pumped hydro, batteries, etc.

Key Contributions

Understanding the opportunities for South Asia's energy storage market

- Assessments of **existing and potential policy and regulatory** barriers for energy storage in South Asia
- **Data-driven analysis** on the technical, economic, and policy drivers for energy storage in a rapidly evolving region

Our Approach to Assessing Storage Opportunities in South Asia

Regulation and Policy Insights

Promote supportive policy and regulatory environments with targeted analysis and insights

Forward Looking

Empower development of sustainable, affordable, reliable power systems by looking at mid- and long-term decision impacts

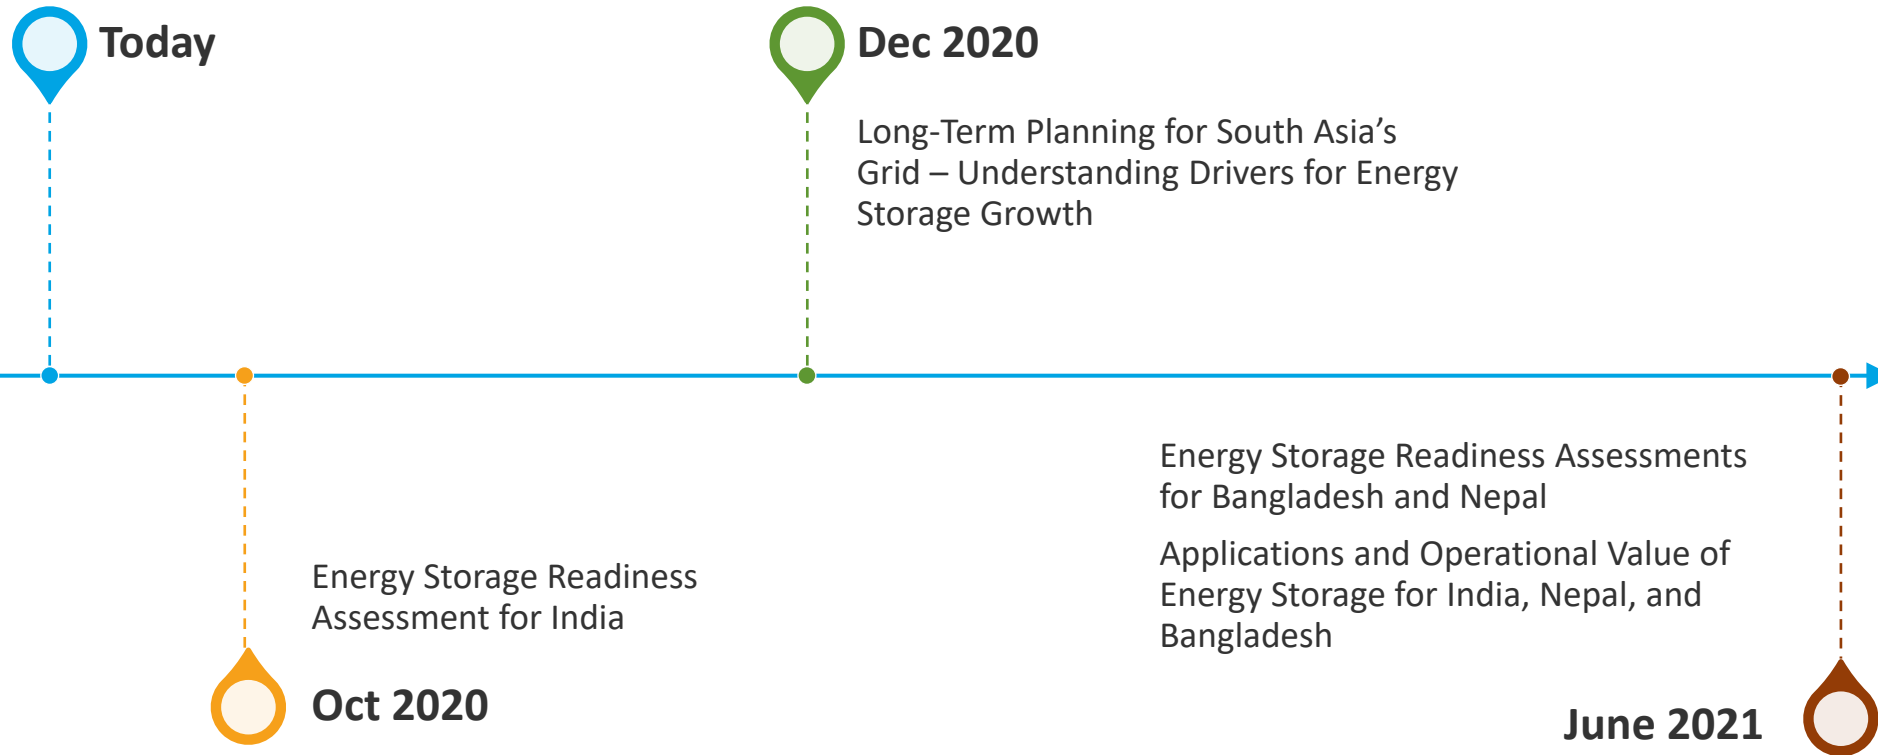

Technology Agnostic

Evaluate a range of technologies to understand the systems-level impacts and opportunities for power system advancements

Timeline for Project

Engaging policymakers, regulators, developers, researchers, and utilities across the South Asia region to guide key objectives

Energy Storage Policy and Regulatory Considerations for South Asia

What is storage used for in practice?

Data from existing storage projects shows that projects are designed to serve multiple needs and access multiple revenue streams.

Energy storage presents a new kind of grid asset

The unique features of ES raise new questions for policymakers and regulators

What

Potential applications cut across generation, transmission, and distribution functions

Who

Structural reforms governing the power sector may prevent investments in sectors that benefit from ES

How

Existing planning and operational practices are not designed to capture the value and limitations of many ES technologies

How are these issues being addressed in practice?

- NYISO creates a new category of “ES resource” able to provide services across multiple sectors and compensation mechanisms
- Policymakers in Texas amend rules to allow utilities to own ES assets
- Innovative tariff design triples fast-moving resources available for frequency regulation in PJM Interconnection
- ERCOT proposed changes to ancillary services to better capture system needs

Current	Proposed	
Regulation Up	Regulation Up	<i>Mostly unchanged</i>
Fast-Responding Regulation Up	Fast-Responding Regulation Up	
Regulation Down	Regulation Down	
Fast-Responding Regulation Down	Fast-Responding Regulation Down	
	Fast Frequency Response 1	59.8 Hz, Limited duration
	Fast Frequency Response 2	59.7 Hz, Longer duration
	Primary Frequency Response	
	Contingency Reserves 1	SCED-dispatched
	Contingency Reserves 2	Manually dispatched
	Supplemental Reserves 1	SCED-dispatched
	Supplemental Reserves 2	Manually dispatched
	Synchronous Inertial Response	Ongoing development
Responsive		
Non-Spin

What enables energy storage deployment and operation?

Energy Storage Readiness Assessment

Topic	Sub-topic
System Characteristics	Decreasing load factor in electricity demand
	Inadequate ancillary services
	Inadequate or costly supply options during peak demand periods
	Increasing levels of transmission congestion
	Network upgrades with low anticipated utilization
	Low flexibility in the generation mix
	Increasing VRE curtailment
Policy	ES included in energy policy and master plan
	Energy strategy promotes operational flexibility
	Support organized knowledge sharing and delivery for scale up and replication
	Capacity or energy targets for ES deployment
	Domestic industrial policy
	Targeted support to early adopters
Regulation	ES able to compete with other grid assets to provide multiple services
	ES able to receive revenue for providing multiple services
	Interconnection processes give ES the right to interconnect and obtains transmission service
	Utilities and third-party providers allowed to make storage investments
	Electricity services charges reflect value of and increase price transparency for energy services
	Operating requirements for fast-responding assets
	Promotion of high-quality standardized technologies through safety standards for ES technologies

Energy Storage Readiness Assessment

The goal of the Readiness Assessment is to allow policymakers and regulators to quickly gauge how well existing policy and regulatory frameworks support ES investments and operation.

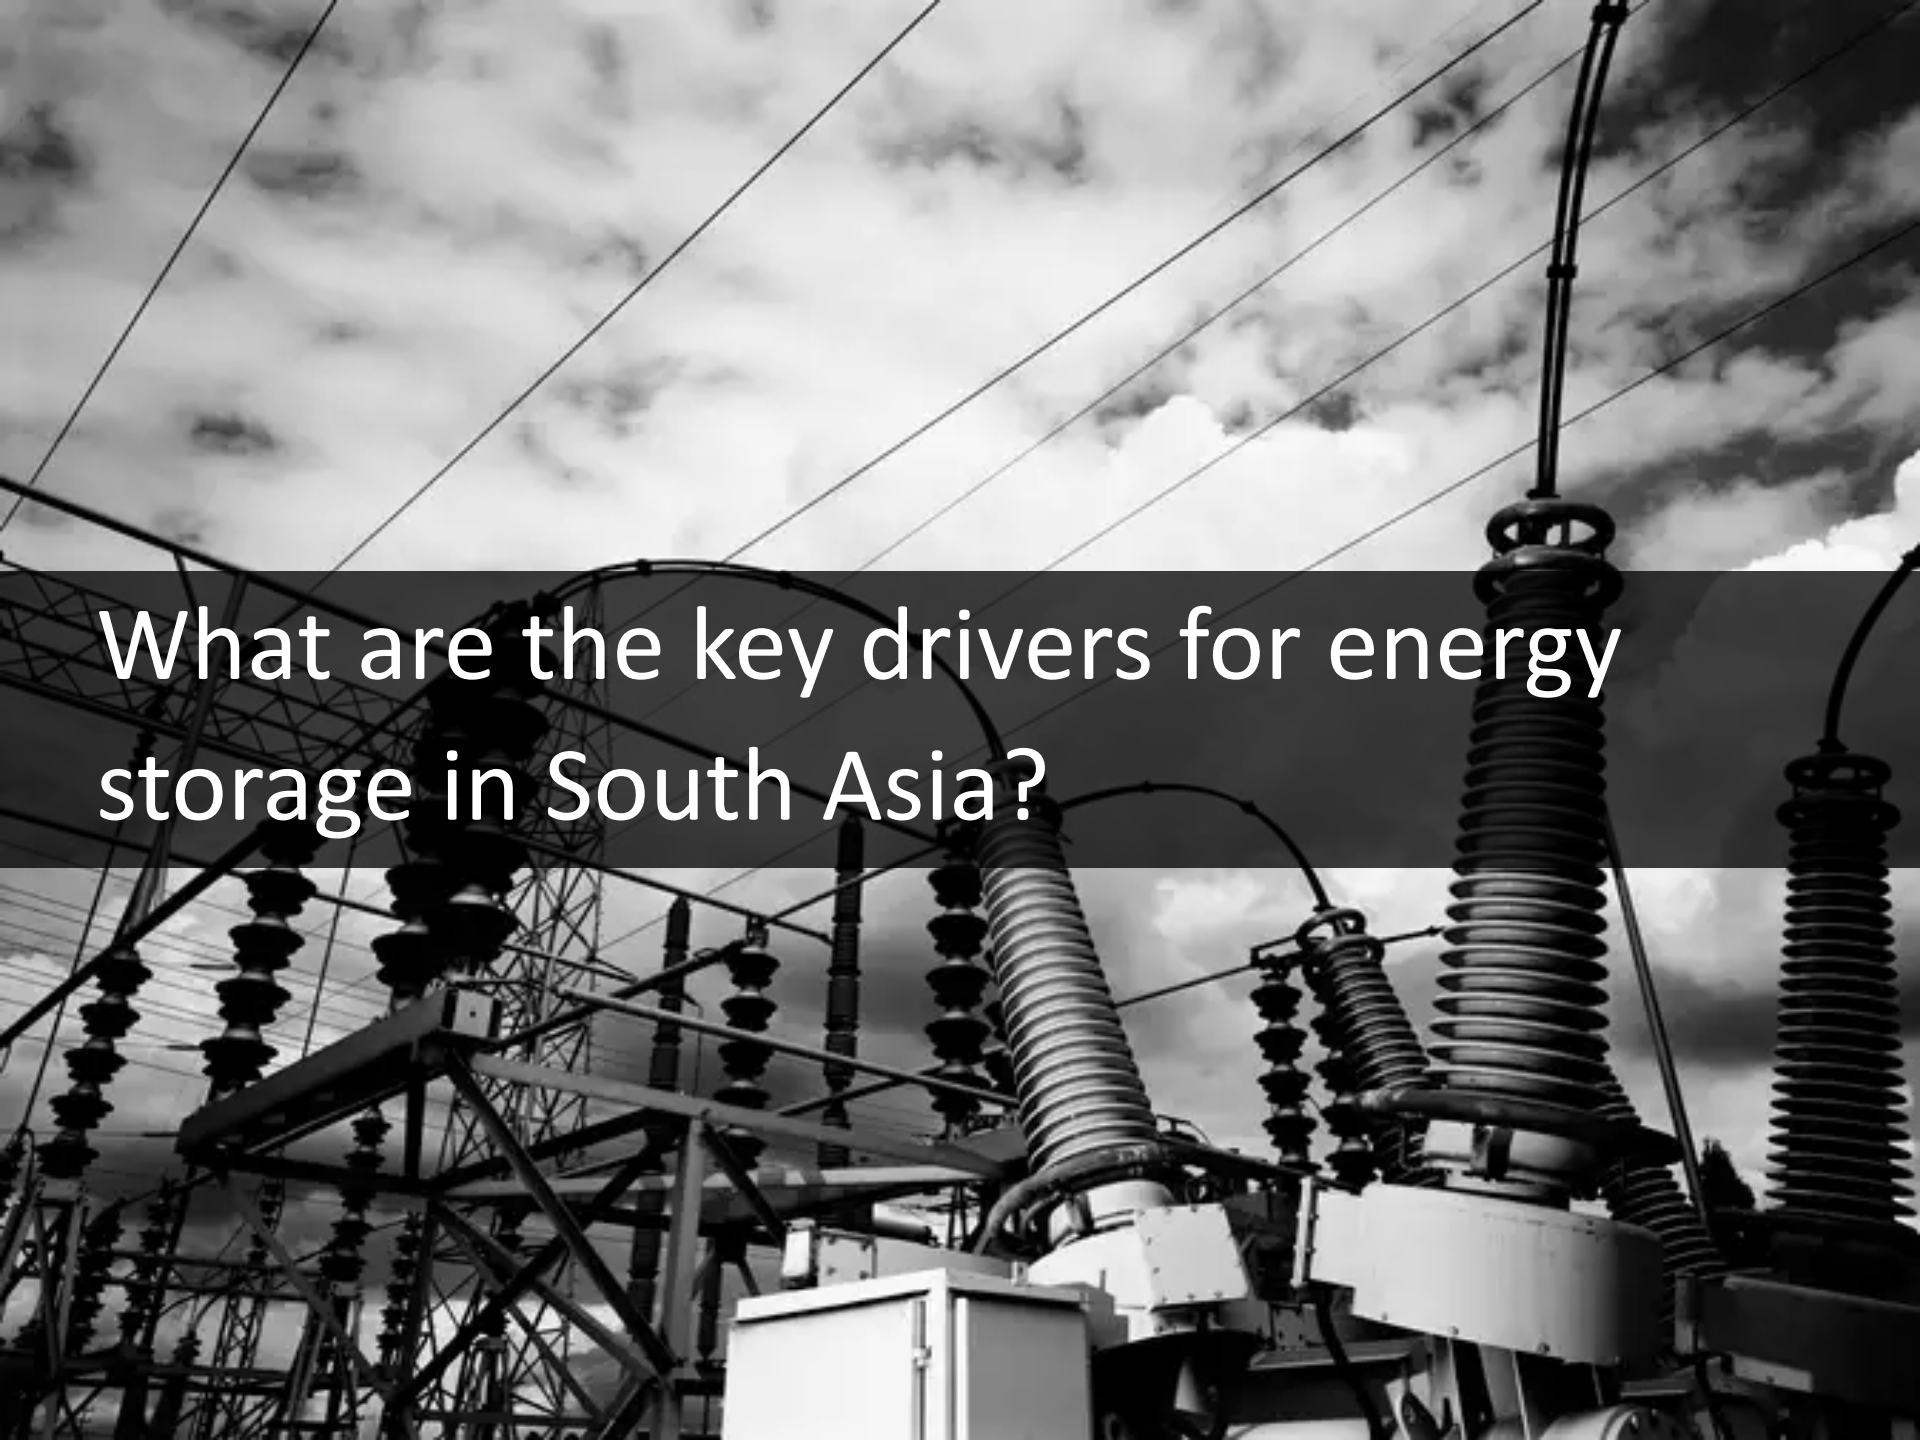

The Readiness Assessment can:

- Identify priority focus areas as policymakers and regulators develop the appropriate suite of policies, programs, and regulations
- Be applied in any jurisdiction regardless of its governance, regulatory, or market structure

The Readiness Assessment CANNOT:

- Recommend specific policy or regulatory solutions
- Inform whether ES is the best solution among other technical and non-technical interventions to meet system needs

Technical and Economic Potential for Energy Storage in South Asia

What are the key drivers for energy storage in South Asia?

Different ES questions require integrated models

↑ years
↓ hours

↑ system
↓ unit

Capacity expansion planning

- Where and when is ES cost-effective?
- How do changes in system costs impact ES investments?
- How do investment opportunities change over time?

Production cost modeling

- Which ES services provide the greatest value to the system?
- How can ES help with RE balancing and reducing curtailment?
- What operational strategies can maximize the value of ES to the grid?

Challenges of valuing ES technologies

Cost-benefit of value stacking becomes more complex

- Use for one application may exclude others
- Uncertainty in load growth, RE targets, and technology costs

Timeframes become more important

- Seasonal vs. intraday services
- Managing state of charge

Coordination required to maximize value of energy-limited resource

- Power vs. energy requirements for different applications
- Need low cost power for charging

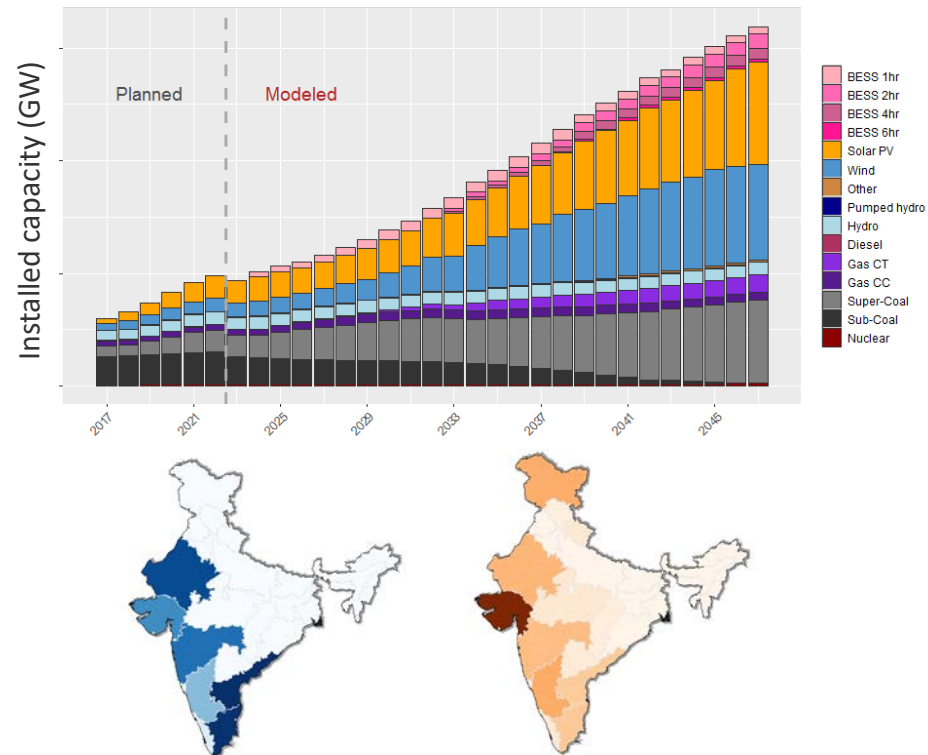

Advanced planning models capture ES technologies and performance

Regional Energy Deployment System (ReEDS) India: [Open-access tool](#) for mid- and long-term capacity expansion

Key Features

- Multi-duration storage
- Capacity credit for storage
- Energy arbitrage value
- Operating reserve value
- Reduced curtailment value
- Augur hourly operational module

Example results

ReEDS finds the mix of generation, transmission, and storage technologies that meet anticipated requirements of the electric sector at least cost

Detailed representation of energy storage operations

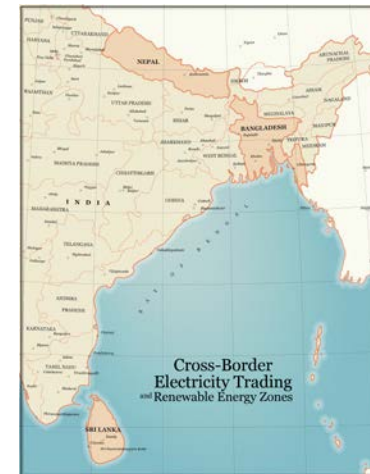

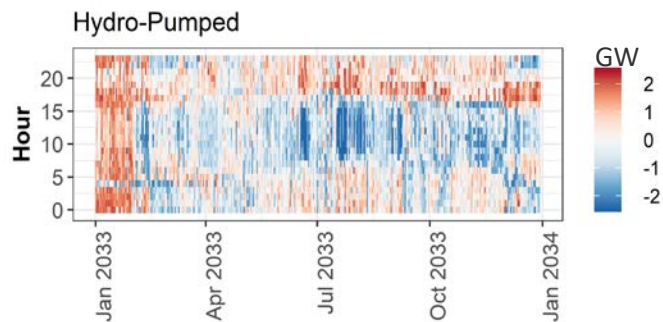

Production cost modeling with unit commitment and economic dispatch simulation using PLEXOS

Key Features

- State-of-charge management
- Energy arbitrage value
- Ancillary services provision
- Scenario-based transmission deferral
- Re-dispatch due to RE forecast errors

Modeling regional operations

- Using existing plans for ES in Nepal, Bangladesh, and Bhutan.
- Different scenarios of ES growth, operations, and market interactions.
- Represent the value of ES technologies for different SA countries.

PLEXOS identifies the operational values of ES across timescales

Scenario analysis identifies drivers for ES value

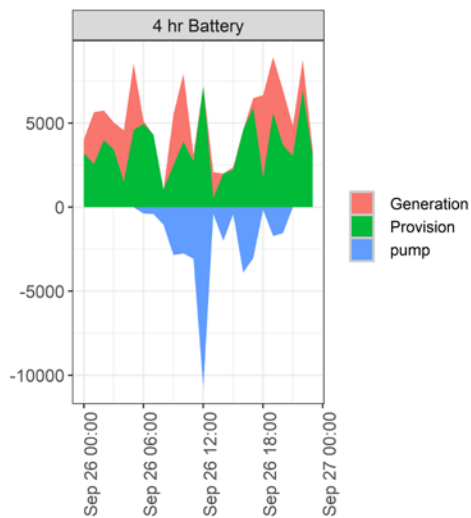

Impacts of cost uncertainty

Impacts of market participation rules

Impacts of operating practices

Transmission congestion and utilization

Conclusions

Key Outcomes

- Regulatory readiness assessments
 - Detailed review of how a country can incentivize ES
- Understanding the key techno-economic drivers
 - Long-term horizon to understand the system changes that drive ES investment
 - Including policy and regulatory environments
 - Operational value to validate short timeframe opportunities for ES

How does this work benefit stakeholders?

Policymakers & Regulators

- Priority focus areas for policy and regulatory development
- Data-driven insights of the role and opportunities for ES
- Quantitative assessment of policy and regulatory impacts on ES models

Operators and Planners

- Strategies to maximize value of ES to the grid
- Feasible pathways for system development
- Advanced open-access planning tools (India specific)

Private Sector

- Investment opportunities
- Risk factors that may impact these opportunities
